

Materiality 3 Safety and Security of People and Local Communities

The Teijin Group will contribute to developing a secure and resilient society with high-performance materials and the Internet of Things (IoT).

In our corporate philosophy, the Teijin Group advocates ensuring the quality of life. People cannot have quality of life if their safety and security are threatened. It is for this reason that we have identified “safety and security of people and local communities” as a materiality.

The Teijin Group has been supplying society with solutions using information technology and high-performance materials providing both security and functionality, such as aramid fiber, which can withstand the high temperatures of fires; super-light ceiling materials that reduce the risk of ceilings collapsing at times of earthquake disaster, and safety confirmation services. The frequency of natural disasters rises and it is impossible to reduce fires and accidents to zero. We are bearing these circumstances in mind and will further strengthen our products and technological development contributing to disaster prevention and mitigation and to reducing damage from disasters, crimes, and conflicts.

Furthermore, by means of our filters utilizing nano-level microtechnology and environmental engineering, we will contribute to ensuring safety and security on the environmental side by preventing the outflow of environment-polluting substances and microplastics, purification, and so on.
